

THE AMAZING RED DEER

FEATURES OF THE RED DEER

Intrestingly, the tall, bony structure on a deer is called an antler(s), Their bony outgrowths are only ever found on the head of a male deer. Antlers take about 100 days (aproximateley),

almost $\frac{1}{3}$ of a year, to grow. After letting them fully grow, Antlers will shed in april/spring.

Suprisingly, Highland Deer eat the antlers to regain the nuttience they lost after shedding.

Intreugingly, antlers can grow from an outstanding 90-100cm long.

Shining like an emerald, the coat of a red deer appears bright, growing more red as summer drives by, after summer, inbetween September to may, they change to a thicker grey brown to defend the cold.

HABITAT

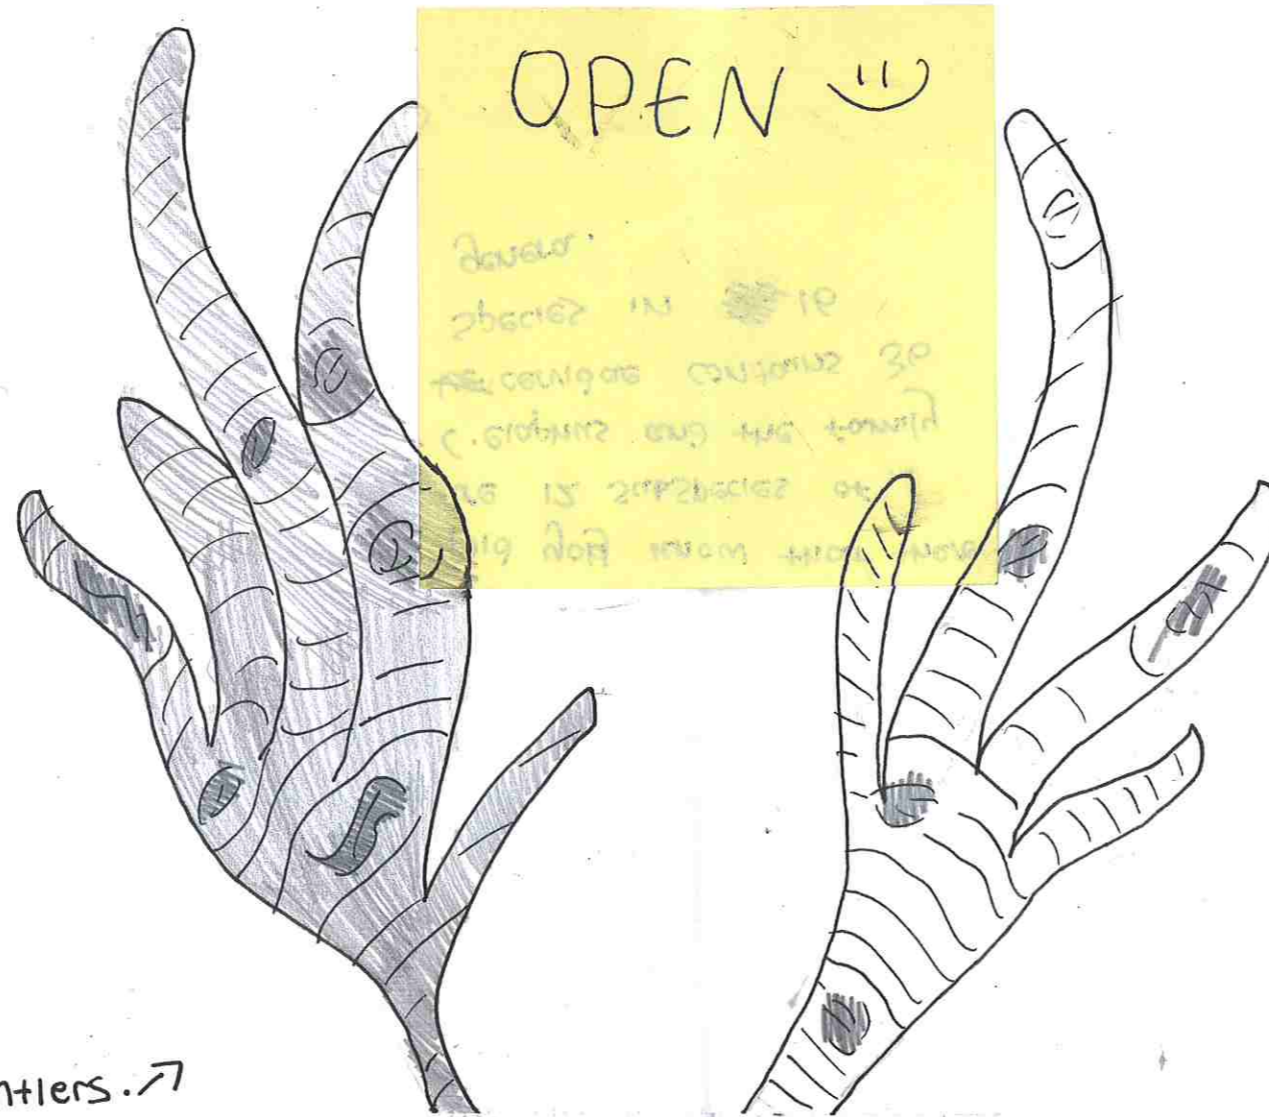

Covering the ground of lots of British woods, The red deer,

(who are highly noturous for their long, sturvy antlers and bright red coats of fur) can mostly be found in central and southern Europe, Also in asia to mongolia to china, and are

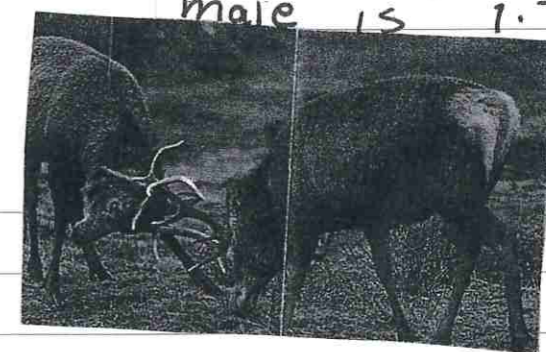

also currentley being introduced to australia, argentina and New zeland.

Reltively common in sutible in common habitats and increasing. Kept away from the dangers of the wild, Red Deer are protected in deer parks both as ornamental and game animals. culling is necessary in many places.

SIZES

comming higher than the average human, the mandatory length for a male is 1.75m - 2.85m

a female being smaller. The Red deer are the largest land

mammal in Britan and one of the largest in Europe. Hight: To shoulder - 75cm - 120cm; females differ. weight = 100kg - 300kg (depending on location and subspecies)
